## Basics of Solar Radiation

- Solar radiation is the radiant energy emitted by the Sun in the form of electromagnetic waves.
- The sun emits vast amount of radiant energy.
- The earth intercepts only a fraction of it.
- It is essential to drive directly or indirectly all biological and physical processes on the Earth.
- The earth is the only planet in the solar system, which receives an optimum amount of solar radiation that makes life sustainable on it.
- $\quad$ Solar spectrum resembles to that of a black body at approximately 5800K.
- $\quad 98 \%$ of the total emitted energy lies in the spectrum ranges from 250 nm to 3000 nm . About half of the radiation is in the visible short-wave part of the electromagnetic spectrum. The other half is mostly in the near-infrared part, with some in the ultraviolet part of the spectrum
- Solar radiation having wavelength less than 0.286 nm (called ultraviolet) is absorbed by ozone layer in stratosphere. The ultraviolet radiation not absorbed by the atmosphere is responsible for the change of color in skin pigments.
- The solar radiation, that traverse the atmosphere further, is subjected to scattering, reflection and absorption by air molecules, aerosols and clouds.
- The radiation budget represents the balance between incoming energy from the Sun and outgoing thermal (longwave) and reflected (shortwave) energy from the Earth. Globally, the budget is balanced. Otherwise the temperature would rise constantly. Locally, the budget is not balanced. Tropical areas get more than they release, while higher latitudes of the winter hemisphere release more than they receive.

## Solar Radiation Budget

The radiation from the Sun travels in the space as electromagnetic wave. Above the earth's atmosphere, sunlight carries 1367 watts of power per square meter. This is known as solar constant. We define solar constant as the amount of solar radiation received outside the earth's atmosphere on a unit area perpendicular to the rays of the sun, at the mean distance of the earth from the sun.

The Earth receives $1.8 \times 10^{17} \mathrm{~W}$ of incoming solar radiation continouosly at top of its atmosphere. But only half of it reaches the earths' surface. Factors like absorption, scattering and reflection of light during its passage through the atmosphere are responsible for reduction of the amount of solar radiation available on the earth's surface (Fig.1). Solar energy is, by nature, a lowdensity energy source.

The solar constant is the amount of incoming solar ras per unit area, measured o the outer surface of Eart atmosphere, in a plane perpendicular to the rays

## The Sun - Main features

## The Solar Spectrum

When solar radiation is passed through a prism, it gets split into several colours. This is the visible portion of the solar radiation. In fact, the radiation from the sun extends into the ultraviolet and infrared spectral regions as well (Fig.2). Solar spectrum resembles to that of a black body at approximately 5800 K . $98 \%$ of the total emitted energy lies in the spectrum ranges from 250 nm to 3000 nm . About half of the radiant energy is in the visible short-wave part of the electromagnetic spectrum. The other half is mostly in the near-infrared part, with some in the ultraviolet part of the spectrum. Solar radiation having wavelength less than 0.286 nm (called ultraviolet) is absorbed by ozone layer in stratosphere. The ultraviolet radiation not absorbed by the atmosphere is responsible for the change of color in skin pigments. The solar radiation that traverses the atmosphere further, is subjected to scattering, reflection and absorption by air molecules, aerosols and clouds.

Individual particles of light are called photons. An individual photon is considered to possess single wavelength depending on its energy content. The range of wavelengths in the solar spectrum is directly due to collection of photons of many different energies. The distribution of photons in a wide energy spectrum has a deciding role in the performance of many solar energy utilization devices.

Fig. 2 The solar spectrum

| Radiation Measurements |  |
| :---: | :---: |
| Parameter | Instruments used |
| Short Wave ( $0.3 \mu-4.0 \mu$ ) |  |
| Direct solar irradiance | Ångström and Thermoelectric Pyrheliometers |
| Global solar irradiance | Thermoelectric Pyranometer |
| Diffuse solar irradiance | Thermoelectric Pyranometer with shading ring |
| Reflected solar irradiance | Inverted Pyranometer |
| Solar spectral irradiance and turbidity | Sunphotometer |
| Long Wave ( $4 \mu-100 \mu$ ) |  |
| Net Terrestrial Radiation | Ângström Pyrgeometer |
| Total ( $0.3 \mu-100 \mu$ ) |  |
| Upward or downward Radiation | Pyradiometer |
| Net Radiation | Net Pyradiometer |

## RADIATION TERMINOLOGY

1. Irradiance $\left(\mathrm{Wm}^{-2}\right)$ : Amount of radiant energy incident on a surface per unit area per unit time.
2. Direct solar irradiance: Solar irradiance on a surface held perpendicular to sun rays and diffuse sky radiation obstructed.
3. Global solar irradiance: Solar irradiance on a horizontal surface due to both direct sun rays and diffuse sky radiation.
4. Diffuse solar irradiance: Solar irradiance on a horizontal surface due to sky radiation only.
5. Reflected solar irradiance: Upward radiant exitance in the short wave range.
6. Net terrestrial radiation: Upward radiant exitance minus downward irradiance in long wave range through a horizontal surface near earth surface
7. Net total irradiance: Downward irradiance minus Upward radiant exitance in entire spectrum
